1 Overview

The tables that are defined in this document explain MOTOR's TSB database in Auto Care Association ACES VCdb vehicle key coding. This dataset covers most domestic and imported car and light truck models. Low census vehicles (including low sales volume and exotic vehicles) may be excluded.

Auto Care Association has established a delivery specification for the communication of parts information in XML format utilizing a defined data schema. This delivery specification can be found in the ACES documentation package, which can be downloaded at http://www.autocare.org/what-we-do/technology/technologyhelp/. The data in this delivery utilizes only the VCdb portion of the ACES standard. The data also deviates from the ACES standard in the following ways:

- The data described in this CDK is delivered in pipe-delimited UTF-8 text file (*.txt), not in XML database format as described in the ACES 3.0 specification.
- The ACES 3.0 XML lists vehicle attributes as elements to be included in an application when applied. Those elements have an attribute name "id", which provides the id value for looking up the attribute description within the VCdb Database. VCdb Attributes in the data described in this document will be listed in the table TSB_Application_VCdbAttribute_xRef. The AttributeName field is the name of the VCdb vehicle attribute and is equivalent to the element name in the ACES 3.0 XML schema, and the AttributeID value is the value that is equivalent to the "id" attribute for that element.
- The ACES Delivery Specification indicates that each application should only contain the VCdb Attributes that are required to differentiate between two or more content records. In our experience, we have found that this can lead to potential errors and miscommunication of data because of implied, or assumed, vehicle coverage. Therefore, in this data, we have included enough vehicle attributes so that each Application resolves to exactly one VCdb Year, Make, Model, SubModel, Region and Engine (YMME) definition.
- As a result of adding enough vehicle attributes to the data so that each Application resolves to a single YMME, we have also added the VCdb VehicleToEngineConfigID value to the records in the TSB_Application. This value represents a complete YMME description in the VCdb database.

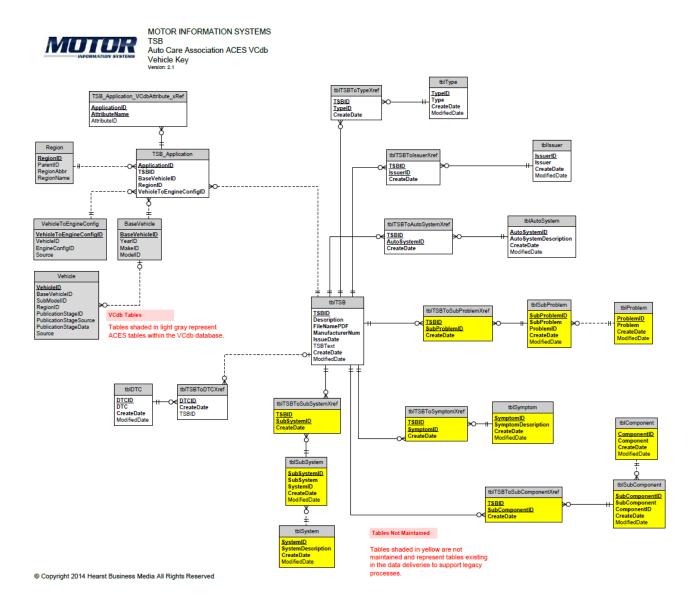

The vehicle data included in this deliverable provides two options for data look-up by vehicle.

- The traditional ACES approach of asking the user to select only the VCdb Attributes required to
 resolve to a single YMME application can be achieved by using the BaseVehicleID and RegionID
 values from the TSB_Application table and any related Vehicle or Engine attributes in the
 TSB_Application_VCdbAttribute_xRef table.
- The YMME application can be determined by looking at the VehicleToEngineConfigID, which
 references the top level table in the VCdb database that brings together Vehicle and Engine
 Attributes. This can be useful when trying to link multiple datasets together using a consistent
 vehicle key. However, when using this approach, the additional non YMME attributes listed in the
 TSB_Application_VCdbAttribute_xRef table should still be presented to the end user to select the
 proper application.

3.9 TSB_Application_VCdbAttribute_xRef

Cross reference table, which links the TSB data to various VCdb attributes that are specified in the VCdb database.

Column Name	Data Type (size)	Required	Description
ApplicationID	Long Integer	Yes	Identifies a unique set of VCdb attributes, which may span multiple rows (i.e., a "set" can include one or more attributes). Each attribute set will be referenced by one or more rows in the TSB_Application table
AttributeName	Text	Yes	(PK) ACES attribute name
AttributeID	Number	Yes	ACES attribute id value

The ACES 3.0 XML lists vehicle attributes as elements to be included in an application when applied. Those elements have an attribute names "id" which provides the id value for looking up the attribute description within the VCdb Database. VCdb Attributes in the data described in this document will be listed in the table TSB_Application_VCdbAttribute_xRef. The AttributeName field is the name of the VCdb vehicle attribute and is equivalent to the element name in the ACES 3.0 XML schema and the AttributeID value is the value that is equivalent to the "id" attribute for that element.
